REVIEW
CASPIAN SEA WATER STAGE FROM April 10 – 16, 2025

In the northern part of the Caspian Sea, according to operational data from marine stations of Kazhydromet: Peshnoy, Kulaly island and Roshydromet (isl. Tyuleniy), the average sea level corresponded to minus 29.03 m, the maximum minus 28.41 m, the minimum minus 29.59 m.

According to the operational data of the sea stations of Kazhydromet: Fort-Shevchenko, Aktau, Fetisovo and Roshydromet (Makhachkala), the average value of the level of the Caspian Sea, in its deep part, corresponded to minus 29.33 m, the maximum minus 28.96 m, the minimum minus 29.64 m.

CRITERIA OF DANGER OF THE STORM SURGES IN THE NORTHEAST COAST

| | Rise/Fall, cm | Characteristic*** | Consequences |
|------------|--------------------------|--------------------------|--|
| Up surge | 50 | Critical | Flooded coast area to 5 km |
| | 65 | Danger | Flooding and flooding of dams and buildings up to 10 km |
| | 110 | Especially danger | Flooding of the coast for more than 10 km, destruction of dams and buildings |
| Down surge | -50 | Critical | worsening navigation conditions for small ships |
| | -65 | Danger | Worsening of navigation conditions for small and medium-sized ships |
| | -100 | Especially danger | Ships would be aground |

** The calculated characteristics were obtained using the hydrodynamic module of the MIKE 21 Flow Model, adapted in RSE "Kazgidromet" to the conditions of the Caspian Sea. Data of sea level measurements and pressure field numerical forecasting for 24 –120 hours were used in computation.*

*** At definition of characteristic marks local conditions were considered.*

**** Critical – 50 % frequency, danger – 25 % frequency, especially danger– 2 % frequency. The calculation was carried out for the period 1940-2020 according to the data of Peshnoy station.*
